

80/100 Series Landcruiser Sway Bar Extensions

With suspension lifts installed, the front & rear sway bars are moved away from the chassis, reducing articulation. The Roadsafe extended sway bar brackets are suited for 4-6" lifts, and allow you to effectively lower the outside sway bar link mount points, to re-introduce the appropriate amount of articulation of the sway bars. During the production cycle of the 80 series cruisers two different styles of bracket were used for the rear - a straight style (mounts to side of chassis), and a 'u' shaped style (mounts to underside of chassis) - please ensure you check the vehicle prior to ordering.
