

IFS UNIVERSAL BUMP STOPS

All IFS vehicles have at least 1 bump stop on the lower control arm with the potential for a droop stop (which limits droop to protect the suspension) on the Upper control arm. Old or modified suspension may require these rubber bump/droop stops to be replaced or upgraded.

Roadsafe 4WD have developed numerous bump stops that can be used in various applications. "Duro" refers to the shore hardness of the material, the higher the number the firmer the rubber. 75 Duro is much the same as any OE part would use and a great option for bolt in upgrades. As we identify any specific bolt in applications we will also advertise their fitment. Sold individually.
